source, and thus could be represented in other CRISP entries. The institution listed is for the Center, which is not necessarily the institution for the investigator. Green fluorescent protein (GFP) is an extremely useful protein reporter that is often used to visualize molecules within the cell and to detect protein-protein interactions. Here, we explored the possibility of determining the FRET efficiency in the context of a viral fusion protein that exhibits a high degree of structural heterogeneity, namely the viral fusion peptide. The peptide's very high degree of structural heterogeneity impeded the design of homogeneous, known, high-efficiency FRET pairs. Thus, a general method for calculating FRET efficiencies between GFP variants using FRET-P was investigated. The method was validated by using both known FRET pairs, and the FRET pair from the viral fusion peptide.

We generated the FRET pairs by placing the GFP variants into transmembrane constructs in the context of a viral fusion protein. The constructs were then characterized in a fusion assay, in which conformational changes are assessed by fluorescence resonance energy transfer (FRET) between donor and acceptor. Q: Can we have a link to the Hot Network Questions on the /newest page? I often find myself wishing I knew some interesting things before posting my questions. Unfortunately, I don't know what are the hot network questions, and the ones I find by googling usually involve concepts I don't know about. Can we add a link to the page containing the hot questions? It would be especially helpful if it would include tags I might not know about, but that wouldn't be necessary, of course. It would certainly help a lot, since getting to know some interesting subjects takes time and effort. A: I don't 82157476af
